

# The **braids** package: codebase

Andrew Stacey  
loopspace@mathforge.org

v2.2 from 2022/10/26

## 1 Introduction

This is a package for drawing braid diagrams using PGF/TikZ. Its inspiration was a question and answer on the website <http://tex.stackexchange.com>.

## 2 History

- v1.0 First public release.
- v1.1 Added ability to configure the gap size, the control points, and the “nudge”.  
Added ability to add labels to strands between crossings.
- v2 Reimplemented as TikZ library rather than a standalone package.

## 3 Implementation

Issue a notice that this is a depreciated version of the **braids** package.

```
1 \PackageWarning{braids}{%
2   This package has been reimplemented as a TikZ library; if starting with a fresh document,
3 }%
```

\ge@addto@macro This is an expanded version of \g@addto@macro. Namely, it adds the *expansion* of the second argument to the first.

```
4 \long\def\ge@addto@macro#1#2{%
5   \begingroup
6   \toks@\expandafter\expandafter\expandafter{\expandafter#1#2}%
7   \xdef#1{\the\toks@}%
8 }
```

(End definition for \ge@addto@macro.)

\braid This is the user command. We start a group to ensure that all our assignments are local, and then call our initialisation code. The optional argument is for any keys to be set.

```
9 \newcommand{\braid}[1][]{%
10  \begingroup
11  \braid@start{#1}}
```

(End definition for \braid. This function is documented on page ??.)

\braid@process This is the token swallower. This takes the next token on the braid specification and passes it to the handler command (in the macro \braid@token) which decides what to do next. (Incidentally, the code here is heavily influenced by TikZ. That's probably not very surprising.)

```

12 \def\braid@process{%
13   \afterassignment\braid@handle\let\braid@token=%
14 }
```

(End definition for \braid@process.)

\braid@process@start This is a variant of \braid@process which is used at the start where we might have a few extra bits and pieces before the braid itself starts. Specifically, we test for the at and (name) possibilities.

```

15 \def\braid@process@start{%
16   \afterassignment\braid@handle@start\let\braid@token=%
17 }
```

(End definition for \braid@process@start.)

\braid@handle@start This is the handler in use at the start. It looks for the tokens a or ( which (might) signal the start of an at (coordinate) or (name). If we get anything else (modulo spaces) we decide that we've reached the end of the initialisation stuff and it is time to get started on the braid itself.

```

18 \def\braid@handle@start{%
19   \let\braid@next=\braid@handle
20   \ifx\braid@token a
```

We got an a so we might have an at (coordinate)

```

21   \let\braid@next=\braid@maybe@locate
22   \else
23   \ifx\braid@token(%)
```

We got an ( so we have a name

```

24   \iffalse\fi %Indentation hack!
25   \let\braid@next=\braid@assign@name
26   \else
27   \ifx\braid@token\@sptoken
```

Space; boring, redo from start

```

28   \let\braid@next=\braid@process@start
29   \fi
30   \fi
31   \fi
32   \braid@next%
33 }
```

(End definition for \braid@handle@start.)

\braid@handle This is the main handler for parsing the braid word. It decides what action to take depending on what the token is. We have to be a bit careful with catcodes, some packages set ; and | to be active. We should probably also be careful with ^ and \_.

```

34 \let\braid@semicolon=;
35 \let\braid@bar=|
36 \def\braid@handle{%
37   \let\braid@next=\braid@process
```

Start by checking our catcodes to see what we should check against

```
38  \ifnum\the\catcode`;=\active
39  \expandafter\let\expandafter\braid@semicolon\tikz@activesemicolon
40  \fi
41  \ifnum\the\catcode`\|==\active
42  \expandafter\let\expandafter\braid@bar\tikz@activebar
43  \fi
44  \ifx\braid@token\braid@semicolon
```

Semicolon, means that we're done reading our braid. It's time to render it.

```
45  \let\braid@next=\braid@render
46  \else
47  \ifx\braid@token`
```

Superscript character, the next token tells us whether it's an over-crossing or an under-crossing.

```
48  \let\braid@next=\braid@sup
49  \else
50  \ifx\braid@token_
```

Subscript character, the next token tells us which strands cross.

```
51  \let\braid@next=\braid@sub
52  \else
53  \ifx\braid@token-
```

Hyphen, this is so that we can have more than one crossing on the same level.

```
54  \braid@increase@levelfalse
55  \else
56  \ifx\braid@token1%
```

1: this means the “identity” crossing, so no crossing here. Increase the level, unless overridden, and add to the label.

```
57  \ifbraid@increase@level
58  \stepcounter{braid@level}
59  \fi
60  \braid@increase@leveltrue
61  \ge@addto@macro\braid@label{\braid@token}%
62  \else
63  \ifx\braid@token[%
```

Open bracket, this means we have some more options to process.

```
64  \let\braid@next=\braid@process@options
65  \else
66  \ifx\braid@token\braid@bar
```

Bar, this tells us that we want a “floor” at this point.

```
67  \edef\braid@tmpf,\expandafter\the\value{braid@level}}%
68  \ge@addto@macro\braid@floors\braid@tmp%
69  \else
70  \ifx\braid@token\bgroup
```

Begin group, which we reinterpret as begining a scope.

```
71  \braid@beginscope
72  \else
73  \ifx\braid@token\bgroup
```

End group, which ends the scope

```
74   \braid@endscope
75   \else
76   \ifx\braid@token\braid@olabel@strand
77     \let\braid@next=\braid@olabel@strand
78   \else
79   \ifx\braid@token\braid@clabel@strand
80     \let\braid@next=\braid@clabel@strand
81   \else
```

Otherwise, we add the token to the braid label.

```
82   \ge@addto@macro\braid@label{\braid@token}%
83   \fi
84   \fi
85   \fi
86   \fi
87   \fi
88   \fi
89   \fi
90   \fi
91   \fi
92   \fi
93   \fi
94   \braid@next%
95 }
```

(End definition for \braid@handle.)

\braid@maybe@locate If we got an a token in the \braid@handle@start then it *might* mean we're looking at at (coordinate) or it might mean that the user has decided to use a as the braid parameter. So we examine the next token for a t.

```
96 \def\braid@maybe@locate{%
97   \afterassignment\braid@@maybe@locate\let\braid@token=%
98 }
```

(End definition for \braid@maybe@locate.)

\braid@@maybe@locate This is where we test for t and act appropriately.

```
99 \def\braid@@maybe@locate{%
100   \let\braid@next=\braid@handle
101   \ifx\braid@token t
102     \let\braid@next=\braid@find@location
103   \fi
104   \braid@next%
105 }
```

(End definition for \braid@@maybe@locate.)

\braid@find@location This macro starts us looking for a coordinate.

```
106 \def\braid@find@location{%
107   \afterassignment\braid@@find@location\let\braid@token=%
108 }
```

(End definition for \braid@find@location.)

\braid@@find@location This is the test for the start of a coordinate. If we get a ( that means we've reached the coordinate. A space means “carry on”. Anything else is a (non-fatal) error.

```

109 \def\braid@@find@location{%
110   \let\braid@next=\braid@location@error
111   \ifx\braid@token(%)
112     \let\braid@next=\braid@locate
113   \else
114     \ifx\braid@token\@sptoken
115       \let\braid@next=\braid@find@location
116     \fi
117   \fi
118   \braid@next%
119 }
```

(End definition for \braid@@find@location.)

\braid@location@error This is our error message for not getting a location.

```

120 \def\braid@location@error{%
121   \PackageWarning{braids}{Could not figure out location for braid}%
122   \braid@process@start%
123 }
```

(End definition for \braid@location@error.)

\braid@locate If we reached a ( when looking for a coordinate, everything up to the next ) is that coordinate. Then we parse the coordinate and call the relocation macro.

```

124 \def\braid@locate#1{%
125   \tikz@scan@one@point\braid@relocate(#1)%
126 }
```

(End definition for \braid@locate.)

\braid@relocate This is the macro that actually does the relocation.

```

127 \def\braid@relocate#1{%
128   #1\relax
129   \advance\pgf@x by -\braid@width
130   \pgftransformshift{\pgfqpoint{\pgf@x}{\pgf@y}}
131   \braid@process@start%
132 }
```

(End definition for \braid@relocate.)

\braid@assign@name This macro saves our name.

```

133 \def\braid@assign@name#1{%
134   \def\braid@name{#1}%
135   \braid@process@start%
136 }
```

(End definition for \braid@assign@name.)

\braid@process@options The intention of this macro is to allow setting of style options mid-braid. (At present, this wouldn't make a lot of sense.)

```

137 \def\braid@process@options#1]{%
138   \tikzset{#1}%
139   \braid@process%
140 }
```

(End definition for \braid@process@options.)

The next macros handle the actual braid elements. Everything has to have a subscript, but the superscript is optional and can come before or after the subscript.

\braid@sup This handles braid elements of the form  $a^{-1}2$ .

```
141 \def\braid@sup#1_#2{%
142   \g@addto@macro\braid@label{_{"#2}^{#1}}%
143   \braid@add@crossing{#2}{#1}%
144 }
```

(End definition for \braid@sup.)

\braid@sub

```
145 % This handles braid elements of the form \Verb+a_1+ or \Verb+a_1^{-1}+.
146 \def\braid@sub#1{%
147   \@ifnextchar^{\braid@sub{#1}}%
148   {\g@addto@macro\braid@label{_{"#1}}\braid@add@crossing{#1}{1}}%
149 }
```

(End definition for \braid@sub.)

\braid@sub Helper macro for \braid@sub.

```
150 \def\braid@sub#1^#2{%
151   \g@addto@macro\braid@label{_{"#1}^{#2}}%
152   \braid@add@crossing{#1}{#2}%
153 }
```

(End definition for \braid@sub.)

\braid@ne Remember what 1 looks like for testing against.

```
154 \def\braid@ne{1}
```

(End definition for \braid@ne.)

\braid@add@crossing This is the macro which adds the crossing to the current list of strands. The strands are stored as *soft paths* (see the TikZ/PGF documentation). So this selects the right strands and then extends them according to the crossing type.

```
155 \def\braid@add@crossing#1#2{%
```

Our crossing type, which is #2, is one of 1 or -1. Our strands are #1 and #1+1.

```
156 \edef\braid@crossing@type{#2}%
157 \edef\braid@this@strand{#1}%
158 \pgfmathtruncatemacro{\braid@next@strand}{#1+1}
```

Increment the level counter, if requested. The controls whether the crossing is on the same level as the previous one or is one level further on.

```
159 \ifbraid@increase@level
160 \stepcounter{braid@level}
161 \fi
```

Default is to request increment so we set it for next time.

```
162 \braid@increase@leveltrue
```

Now we figure out the coordinates of the crossing. ( $\braid@tx, \braid@ty$ ) is the top-left corner (assuming the braid flows down the page). ( $\braid@nx, \braid@ny$ ) is the bottom-right corner (assuming the braid flows down the page). We start by setting ( $\braid@tx, \braid@ty$ ) according to the level and strand number, then shift  $\braid@ty$  by  $\braid@eh$  which is the “edge height” (the little extra at the start and end of each strand). Then from these values, we set ( $\braid@nx, \braid@ny$ ) by adding on the appropriate amount. The heights  $\braid@cy$  and  $\braid@dy$  are for the control points for the strands as they cross. They’re actually the same height, but using two gives us the possibility of changing them independently in a later version of this package. Lastly, we bring  $\braid@ty$  and  $\braid@ny$  towards each other just a little so that there is “clear water” between subsequent crossings (makes it look a bit better if the same strand is used in subsequent crossings).

```

163  \braid@tx=\braid@this@strand\braid@width
164  \braid@ty=\value{braid@level}\braid@height
165  \advance\braid@ty by \braid@eh
166  \braid@nx=\braid@tx
167  \braid@ny=\braid@ty
168  \advance\braid@nx by \braid@width
169  \advance\braid@ny by \braid@height
170  \advance\braid@ty by \braid@nf\braid@height
171  \advance\braid@ny by -\braid@nf\braid@height
172  \braid@cy=\braid@ty
173  \braid@dy=\braid@ny
174  \advance\braid@cy by \braid@cf\braid@height
175  \advance\braid@dy by -\braid@cf\braid@height

```

Now we try to find a starting point for the strand ending here. We might not have used this strand before, so it might not exist.

```

176  \expandafter\let\expandafter\braid@this@path@origin%
177  \csname braid@strand@\braid@this@strand \origin\endcsname

```

If we haven’t seen this strand before, that one will be  $\relax$ .

```
178 \ifx\braid@this@path@origin\relax
```

Haven’t seen this strand before, so initialise it. Record the initial position of the strand.

```
179 \let\braid@this@path\braid@this@strand
```

Start a new soft path.

```

180 \pgfsyssoftpath@setcurrentpath{\empty}
181 \pgfpathmoveto{\pgfpoint{\braid@tx}{0pt}}

```

Save the path as  $\braid@this@path$ .

```

182 \pgfsyssoftpath@getcurrentpath{\braid@this@path}
183 \else

```

We have seen this before, so we simply copy the associated path in to  $\braid@this@path$ .

```

184 \expandafter\let\expandafter\braid@this@path%
185 \csname braid@strand@\braid@this@path@origin\endcsname
186 \fi

```

Now we do the same again with the other strand in the crossing.

```

187 \expandafter\let\expandafter\braid@next@path@origin%
188 \csname braid@strand@\braid@next@strand \origin\endcsname
189 \ifx\braid@next@path@origin\relax
190 \let\braid@next@path\braid@next@strand

```

```

191  \pgfsyssoftpath@setcurrentpath{@empty}
192  \pgfpathmoveto{\pgfpoint{\braid@nx}{0pt}}
193  \pgfsyssoftpath@getcurrentpath{\braid@next@path}
194  \else
195  \expandafter\let\expandafter\braid@next@path%
196  \csname braid@strand@\braid@next@path@origin\endcsname
197  \fi

```

Now that we have the paths for our two strands, we extend them to the next level. We start by selecting the first path.

```
198  \pgfsyssoftpath@setcurrentpath{\braid@this@path}
```

Draw a line down to the current level, note that this line is always non-trivial since we shifted the corners of the crossing in a little.

```
199  \pgfpathlineto{\pgfqpoint{\braid@tx}{\braid@ty}}
```

Curve across to the next position. Depending on the crossing type, we either have a single curve or we have to break it in two. Our gap is to interrupt at times determined by the gap key.

```

200 \pgfmathsetmacro{\braid@gst}{0.5 - \pgfkeysvalueof{/pgf/braid/gap}}%
201 \pgfmathsetmacro{\braid@gend}{0.5 + \pgfkeysvalueof{/pgf/braid/gap}}%
202 \ifx\braid@crossing@type\braid@over@cross

```

We're on the overpass, so just one curve needed.

```

203  \pgfpathcurvetoh{\pgfqpoint{\braid@tx}{\braid@cy}}%
204  {\pgfqpoint{\braid@nx}{\braid@dy}}%
205  {\pgfqpoint{\braid@nx}{\braid@ny}}
206 \else

```

We're on the underpass, so we need to interrupt our path to allow the other curve to go past.

```

207  \pgfpathcurvebetweenetime{0}{\braid@gst}%
208  {\pgfqpoint{\braid@tx}{\braid@ty}}%
209  {\pgfqpoint{\braid@tx}{\braid@cy}}%
210  {\pgfqpoint{\braid@nx}{\braid@dy}}%
211  {\pgfqpoint{\braid@nx}{\braid@ny}}%
212  \pgfpathcurvebetweenetime{\braid@gend}{1}%
213  {\pgfqpoint{\braid@tx}{\braid@ty}}%
214  {\pgfqpoint{\braid@tx}{\braid@cy}}%
215  {\pgfqpoint{\braid@nx}{\braid@dy}}%
216  {\pgfqpoint{\braid@nx}{\braid@ny}}
217 \fi

```

We're done with this path, so now we save it.

```
218  \pgfsyssoftpath@getcurrentpath{\braid@this@path}
```

Now do the same with the second path.

```

219  \pgfsyssoftpath@setcurrentpath{\braid@next@path}
220  \pgfpathlineto{\pgfqpoint{\braid@nx}{\braid@ty}}
221 \ifx\braid@crossing@type\braid@over@cross
222  \pgfpathcurvebetweenetime{0}{\braid@gst}%
223  {\pgfqpoint{\braid@nx}{\braid@ty}}%
224  {\pgfqpoint{\braid@nx}{\braid@cy}}%
225  {\pgfqpoint{\braid@tx}{\braid@dy}}%
226  {\pgfqpoint{\braid@tx}{\braid@ny}}
227  \pgfpathcurvebetweenetime{\braid@gend}{1}%

```

```

228   {\pgfqpoint{\braid@nx}{\braid@ty}}%
229   {\pgfqpoint{\braid@nx}{\braid@cy}}%
230   {\pgfqpoint{\braid@tx}{\braid@dy}}%
231   {\pgfqpoint{\braid@tx}{\braid@ny}}%
232 \else
233   \pgfpathcurveto{\pgfqpoint{\braid@nx}{\braid@cy}}%
234   {\pgfqpoint{\braid@tx}{\braid@dy}}%
235   {\pgfqpoint{\braid@tx}{\braid@ny}}%
236 \fi
237 \pgfsyssoftpath@getcurrentpath{\braid@next@path}

```

Now save the paths to their proper macros again.

```

238 \expandafter\let%
239 \csname braid@strand@\braid@this@path@origin \endcsname%
240 \braid@this@path
241 \expandafter\let%
242 \csname braid@strand@\braid@next@path@origin \endcsname%
243 \braid@next@path

```

Now update the origins

```

244 \expandafter\let%
245 \csname braid@strand@\braid@this@strand @origin\endcsname%
246 \braid@next@path@origin
247 \expandafter\let%
248 \csname braid@strand@\braid@next@strand @origin\endcsname%
249 \braid@this@path@origin

```

increment the strand counter, if necessary

```

250 \pgfmathparse{\value{braid@strands} < \braid@next@strand ?
251   "\noexpand\setcounter{braid@strands}{\braid@next@strand}" : ""}
252 \pgfmathresult

```

And merrily go on our way with the next bit of the braid specification.

```

253 \braid@process%
254 }

```

(*End definition for \braid@add@crossing.*)

\braid@olabel@strand This macro allows us to label a strand just before a crossing. The first argument is the strand number at that particular crossing and the second is the label. We also save the current height. This version takes the strand number as meaning the *original* ordering.

```

255 \newcommand{\braid@olabel@strand}[3][]{%
256   \edef\braid@tmp{\the\value{braid@level}}%
257   \expandafter\ifx\csname braid@strand@#2@origin\endcsname\relax
258   \g@addto@macro\braid@tmp{\#2}%
259   \else
260   \edef\braid@tmpa{\csname braid@strand@#2@origin\endcsname}%
261   \g@addto@macro\braid@tmp{\braid@tmpa}%
262   \fi
263   \g@addto@macro\braid@tmp{\#3\#1}%
264   \g@addto@macro{\braid@strand@labels}{\braid@tmp}%
265   \braid@process%
266 }

```

(*End definition for \braid@olabel@strand.*)

\braid@clabel@strand This macro allows us to label a strand just before a crossing. The first argument is the strand number at that particular crossing and the second is the label. We also save the current height. This version takes the strand number as meaning the *current* ordering.

```

267 \newcommand{\braid@clabel@strand}[3][]{%
268   \edef\braid@tmp{{\the\value{braid@level}}}{%
269   \g@addto@macro{\braid@tmp}{#2}{#3}{#1}}{%
270   \g@addto@macro{\braid@strand@labels}{\braid@tmp}{%
271   \braid@process}{%
272 }

```

(End definition for \braid@clabel@strand.)

\braid@floors@trim The list of floors, if given, will start with a superfluous comma. This removes it.

```

273 \def\braid@floors@trim,{}

```

(End definition for \braid@floors@trim.)

\braid@render@floor This is the default rendering for floors: it draws a rectangle.

```

274 \def\braid@render@floor{%
275   \draw (\floorsx,\floorsy) rectangle (\floorex,\floorey);%
276 }

```

(End definition for \braid@render@floor.)

\braid@render@strand@labels This starts rendering the labels on the strands at the crossings.

```

277 \def\braid@render@strand@labels#1{%
278   \def\braid@tmp{#1}%
279   \ifx\braid@tmp\pgfutil@empty
280   \let\braid@next=\pgfutil@gobble
281   \else
282   \let\braid@next=\braid@@render@strand@labels
283   \fi
284   \braid@next{#1}%
285 }

```

(End definition for \braid@render@strand@labels.)

\braid@@render@strand@labels This is the actual renderer.

```

286 \def\braid@@render@strand@labels#1#2#3#4{%

(End definition for `\braid@render@strand@labels.`)

`\braid@render` This is called at the end of the braid and it renders the braids and floors according to whatever has been built up up to now.

```
361 \def\braid@render{
```

Check for floors since we do them first.

```

362     \ifx\braid@floors\empty
363     \else

```

Have some floors, start a scope and prepare to render them.

```
364     \pgfsys@beginscope
```

Clear the path (just to be sure).

```
365     \pgfsssoftpath@setcurrentpath{\empty}
```

Trim the initial comma off the list of floors.

```
366     \edef\braid@floors{\expandafter\braid@floors@trim\braid@floors}
```

Initialise our horizontal coordinates.

```

367     \braid@tx=\braid@width
368     \advance\braid@tx by \braid@eh
369     \braid@nx=\value{\braid@strands}\braid@width
370     \advance\braid@nx by -\braid@eh

```

Loop over the list of floors.

```

371     \foreach \braid@f in \braid@floors {
372         \pgfsys@beginscope

```

Figure out the vertical coordinates for the current floor.

```

373         \braid@ty=\braid@f\braid@height
374         \advance\braid@ty by \braid@eh
375         \advance\braid@ty by \braid@height
376         \braid@ny=\braid@ty
377         \advance\braid@ny by \braid@height

```

Save the coordinates for use in the floor rendering macro.

```

378     \edef\floorsx{\the\braid@tx}
379     \edef\floorsy{\the\braid@ty}
380     \edef\floorex{\the\braid@nx}
381     \edef\floorey{\the\braid@ny}
382     \let\tikz@options=\pgfutil@empty

```

Load general floor style options.

```
383     \expandafter\tikzset\expandafter{\braid@floors@style}
```

Load any style options specific to this floor. We're actually offset by 2 from what the user thinks the floor level is.

```
384     \pgfmathtruncatemacro{\braid@ff}{\braid@f+2}
```

Load the relevant floor style, if it exists.

```
385      \expandafter\let\expandafter\braid@floor@style%
386      \csname braid@options@floor@\braid@ff\endcsname
387      \ifx\braid@floor@style\relax
388      \else
```

There is a floor style for this level, so process it.

```
389      \expandafter\tikzset\expandafter{\braid@floor@style}%
390      \fi
```

The `\tikzset` just parses the options, we need to call `\tikz@options` to actually set them.

```
391 \tikz@options
```

Now we call the rendering code.

```
392 \braid@render@floor
```

Done! End the scope for *this* floor and go again.

```
393 \pgf@sys@endscope
394 }
```

Done rendering floors, end the scope.

```
395 \pgf@sys@endscope
396 \fi
```

Finished with floors (if we had them), now get on with the strands.

```
397 \stepcounter{braid@level}
398 \foreach \braid@k in {1,...,\value{braid@strands}} {
```

Start a local scope to ensure we don't mess with other braids

```
399 \pgf@sys@beginscope
```

Default is to draw each braid

```
400 \tikz@mode@drawtrue%
401 \let\tikz@mode=\pgfutil@empty
402 \let\tikz@options=\pgfutil@empty
```

(x,y) coordinates of bottom of strand

```
403 \braid@tx=\braid@k\braid@width
404 \braid@ty=\value{braid@level}\braid@height
405 \advance\braid@ty by 2\braid@eh
```

Try to find the starting point of this strand

```
406 \expandafter\let\expandafter\braid@path@origin%
407 \csname braid@strand@\braid@k @origin\endcsname
408 \ifx\braid@path@origin\relax
```

If that doesn't exist, we'll just draw a straight line so we move to the top of the current position

```
409 \pgf@syssoftpath@setcurrentpath{\emptyset}
410 \pgfpathmoveto{\pgfqpoint{\braid@tx}{0pt}}
411 \let\braid@path@origin\braid@k
412 \else
```

If the path does exist, we load it

```
413 \expandafter\let\expandafter\braid@path%
414 \csname braid@strand@\braid@path@origin\endcsname
415 \pgf@syssoftpath@setcurrentpath{\braid@path}
416 \fi
```

Extend the path to the bottom

```
417      \pgflineto{\pgfqpoint{\braid@tx}{\braid@ty}}
```

Load common style options

```
418      \expandafter\tikzset\expandafter{\braid@style}
```

Load any style options specific to this strand

```
419      \expandafter\let\expandafter\braid@style%
420      \csname braid@options@strand@\braid@path@origin\endcsname
421      \ifx\braid@style\relax
422      \else
423      \expandafter\tikzset\expandafter{\braid@style}
424      \fi
425 \braid@options
426   \tikz@mode
427   \tikz@options
```

This is the command that actually draws the strand.

```
428      \edef\tikz@temp{\noexpand\pgfusepath{%
429          \iftikz@mode@draw draw\fi%
430      }%
431      \tikz@temp}
```

If our braid has a name, we label the ends of the strand.

```
432 \ifx\braid@name\pgfutil@empty
433 \else
```

Label the ends of the strand.

```
434 \coordinate (\braid@name-\braid@path@origin-e) at (\braid@tx,\braid@ty);
435 \coordinate (\braid@name-rev-\braid@k-e) at (\braid@tx,\braid@ty);
436 \braid@nx=\braid@path@origin\braid@width
437 \coordinate (\braid@name-\braid@path@origin-s) at (\braid@nx,0pt);
438 \coordinate (\braid@name-rev-\braid@k-s) at (\braid@nx,0pt);
439 \fi
```

Done with this strand, close the scope and do the next one.

```
440     \pgfsys@endscope
441 }
```

If our braid has a name, we also want to label the centre.

```
442 \ifx\braid@name\pgfutil@empty
443 \else
444 \braid@tx=\value{braid@strands}\braid@width
445 \braid@ty=\value{braid@level}\braid@height
446 \advance\braid@ty by 2\braid@eh
447 \advance\braid@tx by \braid@width
448 \braid@tx=.5\braid@tx
449 \braid@ty=.5\braid@ty
450 \coordinate (\braid@name) at (\braid@tx,\braid@ty);
451 \fi
```

Now we label the strands if needed.

```
452 \ifx\braid@strand@labels\pgfutil@empty
453 \else
454 \expandafter\braid@render@strand@labels\braid@strand@labels{}%
455 \fi
```

All done now, close the scope and end the group (which was opened right at the start).

```
456     \pgf@sys@endscope  
457     \endgroup
```

(*End definition for \braid@render.*)

\braid@start This starts off the braid, initialising a load of stuff. We start a PGF scope, set the level to  $-1$ , the label, floors, and name to empty, process any options we're given, and save certain lengths for later use..

```

610 \tikzset{
611   braid/.pic={
612     \__braid_parse_word:n {#1}
613     \__braid_count:
614     \__braid_render:
615   },
616   floor/.pic={
617     \path[pic~ actions, draw=none] (0,0) rectangle (1,1);
618     \path[pic~ actions, fill=none] (0,0) -- (1,0) (0,1) -- (1,1);
619   },
620   /tikz/braid/.search~ also={/tikz},
621   braid/.cd,

```

The various TikZ parameters for the braid.

The anchor determines which part of the braid is located at the position specified by the pic. It can be of the form `n-m` where `n` is a strand number and `+m+` is a crossing level. The strand number can be either a number or `rev-n` to use the ending numbering of the strands. The crossing level can also be `s` or `e` which means the actual start or end of the strand (including the border).

```
622   anchor/.initial=1-s,
```

`number of strands` sets a minimum for the number of strands in the braid (otherwise, it is set by the strands used in the specified crossings).

```
623   number~ of~ strands/.initial=0,
```

`height` is the distance between crossings (can be negative).

```
624   height/.initial=-1cm,
```

`width` is the distance between strands (can be negative).

```
625     width/.initial=1cm,
```

`gap` is for determining the gap in the under-strand of a crossing.

```
626     gap/.initial=.05,
```

`border height` is a length added at the start and end of each strand.

```
627     border~ height/.initial=.25cm,
```

`floor border` is added to the width of any floors

```
628     floor~ border/.initial=.25cm,
```

`floors` is a list of floors to draw, specified as a cclist of coordinates as (x,y,w,h,a) in which the units are numbers of strands and crossing levels. The parameters are: coordinates of lower left corner, width, height, (optional) name for styling.

```
629     add~ floor/.code={
```

```
630         \seq_push:Nn \l_braid_floors_seq {#1}
```

```
631     },
```

`control factor` determines the proportion of the `height` used for the control points.

```
632     control~ factor/.initial=.5,
```

`nudge factor` is used to compress each crossing slightly within its rectangle.

```
633     nudge~ factor/.initial=.05
```

```
634 }
```

\\_\\_braid\\_parse\\_word:Nn Parse the braid word as a token list and convert it into a sequence.

```

We step through the braid specification, looking for special characters. To avoid catcode issues, the comparison is as strings. Some actions may involve consuming more tokens from the list so we can't do a simple `map_inline` but have to keep stripping off the head token.

The idea is to store information about the current crossing in a token list (noting that it may be specified in a variety of orders) and then when we're sure we have all the information we add it to our sequence of crossings.

745      }
746 }
```

(End definition for `\_braid_parse_index:n`.)

`\_braid_parse_exponent:n` Parse an exponent, basically testing to see if it is  $-1$  in which case our crossing numbers should be reversed..

```
747 \cs_new_nopar:Npn \_braid_parse_exponent:n #1
748 {
749     \int_compare:nTF {#1 == -1}
750     {
751         \bool_set_true:N \l__braid_swap_crossing_bool
752     }
753     {
754         \bool_set_false:N \l__braid_swap_crossing_bool
755     }
756 }
```

(End definition for `\_braid_parse_exponent:n`.)

`\_braid_do_identity:`

```
757 \cs_new_nopar:Npn \_braid_do_identity:
758 {
759 }
```

(End definition for `\_braid_do_identity:..`)

`\_braid_count:NNN` Work out how big the braid is by counting strands and levels. We also figure out the permutation from the start to end of the strands. This is useful for labelling various parts of the braid.

```
760 \cs_new_nopar:Npn \_braid_count:
761 {
762     \int_zero:N \l__braid_length_int
763     \int_set:Nn \l__braid_strands_int {\_braid_value:n {number~of~strands}}
764     \prop_clear:N \l__braid_permutation_prop
765     \prop_clear:N \l__braid_crossing_permutation_prop
766     \prop_clear:N \l__braid_anchor_prop
767     \prop_clear:N \l__braid_inverse_prop
768
769     \seq_map_inline:Nn \l__braid_word_seq
770 }
```

Clear the crossing sequence and assume we're going to step the level.

```
771     \seq_clear:N \l__braid_crossing_seq
772     \bool_set_true:N \l__braid_step_level_bool
773     \bool_set_false:N \l__braid_swap_crossing_bool
```

Run the details of this crossing.

```
774     ##1
```

If we're increasing the level (no hyphen), do so.

```
775     \bool_if:NT \l__braid_step_level_bool
776     {
777         \int_incr:N \l__braid_length_int
778     }
```

If we have a crossing, check we have enough strands to cover it.

```

779   \seq_if_empty:NF \l__braid_crossing_seq
780   {
781     \seq_map_inline:Nn \l__braid_crossing_seq
782     {
783       \int_set:Nn \l__braid_strands_int
784       {
785         \int_max:nn {\l__braid_strands_int} {####1}
786       }
787     }
788   }
789 }
```

Now that we know how many strands we have, we can initialise our permutation props. One will hold the overall permutation, the other will keep track of our current permutation.

```

790   \int_step_inline:nnnn {1} {1} {\l__braid_strands_int}
791   {
792     \prop_put:Nnn \l__braid_permutation_prop {##1} {##1}
793     \prop_put:Nnn \l__braid_anchor_prop {##1} {##1}
794     \prop_put:Nnn \l__braid_crossing_permutation_prop {##1} {##1}
795   }
```

Now we step through the braid word again and record the permutations so that we can calculate the overall permutation defined by the braid.

We will also figure out our shift from the anchor, so first we need to get some information about the anchor.

If the anchor specification has a hyphen then it is of the form strand-level, otherwise it is an anchor as if the whole braid were contained in a rectangular node.

```

796   \tl_set:Nx \l__braid_tmpa_tl {\_braid_value:n {anchor}}
797   \tl_if_in:NnTF \l__braid_tmpa_tl {-}
798   {
799     \seq_set_split:NnV \l__braid_anchor_seq {-} \l__braid_tmpa_tl
800
801     \tl_set:Nx \l__braid_tmpa_tl {\seq_item:Nn \l__braid_anchor_seq {1}}
802     \tl_if_eq:VnTF \l__braid_tmpa_tl {rev}
803     {
804       \tl_set:Nx \l__braid_anchor_strand_tl {\seq_item:Nn \l__braid_anchor_seq {2}}
805       \tl_set:Nx \l__braid_anchor_level_tl {\seq_item:Nn \l__braid_anchor_seq {3}}
806     }
807     {
808       \tl_set:Nx \l__braid_anchor_strand_tl {\seq_item:Nn \l__braid_anchor_seq {1}}
809       \tl_set:Nx \l__braid_anchor_level_tl {\seq_item:Nn \l__braid_anchor_seq {2}}
810     }
811 }
```

The important information is as to the level at which the requested anchor resides. If it is at the end or start of a strand, we set the level to  $-1$  so that it never matches a level number.

```

811   \tl_if_eq:VnTF \l__braid_anchor_level_tl {s}
812   {
813     \int_set:Nn \l__braid_anchor_level_int {-1}
814   }
815   {
816     \tl_if_eq:VnTF \l__braid_anchor_level_tl {e}
```

```

817      {
818        \int_set:Nn \l__braid_anchor_level_int {-1}
819      }
820      {
821        \int_set:Nn \l__braid_anchor_level_int
822          {\tl_use:N \l__braid_anchor_level_tl}
823      }
824    }
825  }
826 {

```

There wasn't a hyphen in the anchor specification, so assume it's an anchor on a node surrounding the entire braid. For now, set the anchor strand and level to  $-1$ .

```

827      \int_set:Nn \l__braid_anchor_level_int {-1}

857          {
858            \seq_item:Nn \l__braid_crossing_seq {\l__braid_tmpb_int}
859          } \l__braid_tmpa_tl
860          \prop_put:NxV \l__braid_permutation_prop
861          {
862            \seq_item:Nn \l__braid_crossing_seq {\l__braid_tmpa_int}
863          } \l__braid_tmpb_tl
864        }

```

See if the current level is what was requested by the anchor.

```
865      \int_compare:nT {\l__braid_crossing_int = \l__braid_anchor_level_int}
```

```

866   {
867     \prop_set_eq:NN \l__braid_anchor_prop \l__braid_permutation_prop
868   }
869   \bool_if:NT \l__braid_step_level_bool
870   {
871     \int_incr:N \l__braid_crossing_int
872   }
873 }
```

This inverts the anchor permutation.

```

874   \int_step_inline:nnnn {1} {1} {\l__braid_strands_int}
875   {
876     \prop_get:NnN \l__braid_anchor_prop {##1} \l__braid_tmpa_tl
877     \prop_put:NVn \l__braid_inverse_prop \l__braid_tmpa_tl {##1}
878   }
879   \prop_set_eq:NN \l__braid_anchor_prop \l__braid_inverse_prop
```

This inverts the full permutation.

```

880   \int_step_inline:nnnn {1} {1} {\l__braid_strands_int}
881   {
882     \prop_get:NnN \l__braid_permutation_prop {##1} \l__braid_tmpa_tl
883     \prop_put:NVn \l__braid_inverse_prop \l__braid_tmpa_tl {##1}
884 }
```

Now that we have the inverse, we can figure out our anchor. If the strand was recorded as  $-1$ , then we want to figure out the position from the braid as a whole so we don't bother with processing.

```

885   \tl_if_eq:VnF \l__braid_anchor_strand_tl {-1}
886   {
```

Now, see if we requested a strand by its position at the end of the braid.

```
